- 1) create ionic project
- 2) platform add iOS / android
- 3) plugin add

ionic cordova plugin add onesignal-cordova-plugin npm install --save @ionic-native/onesignal

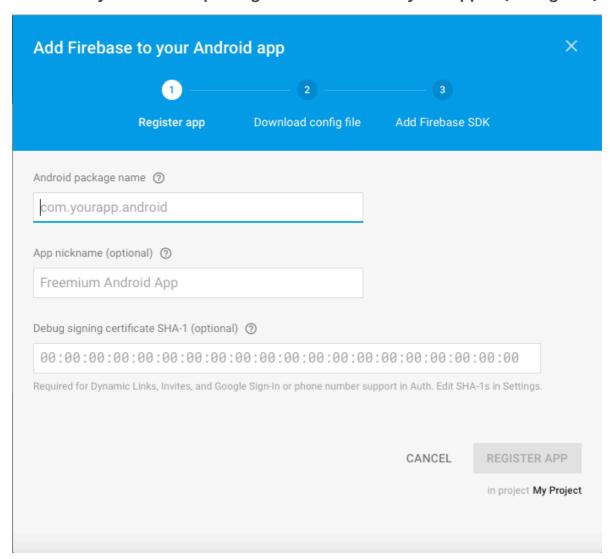

4) create app in firebase console then Select Android

android -

Android package name (same as your ionic project "app id" config.xml)

ex - com.abcd.myapp , io.ionic.starter download google-service.json file and put in main project root. next to continue REGISTER APP

make sure your Android package name is same as your app id (config.xml)

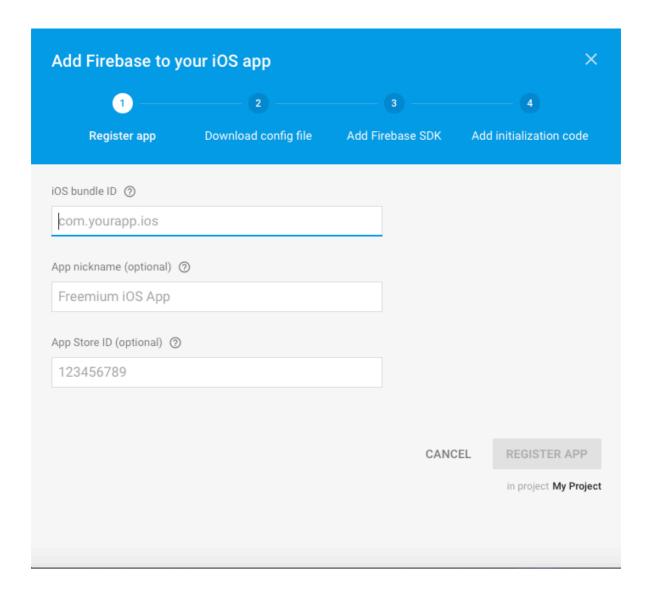

iOS bundle ID (same as your ionic project "app id" config.xml) ex - com.abcd.myapp , io.ionic.starter

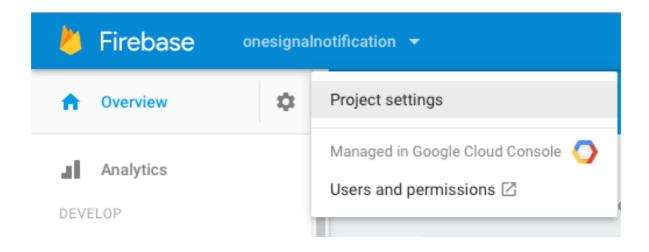

Download GoogleService-info.plist and put in iOS platform root

folder.

next to continue REGISTER APP.

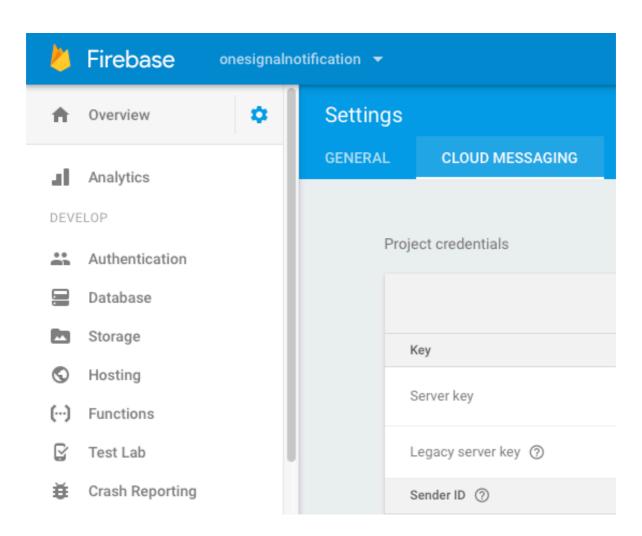

5) after create app in firebase go to "Project Setting"

6) go to CLOUD MESSAGING tab

most important thing is "Legacy server key" and "Sender ID"

7) Create One Signal App go to App Setting and configure particular platform select android for CONFIGURE

Google Server API Key = Legacy server key (from Firebase project)

Google Project Number = Sender ID (from Firebase project)

- 8) demo code for push notification.
- 9) go to Onesignal "Notification" tab and generate notification and send it.
- 10) get notification to your app.
